

HR Management System - Database Structure

The database is structured to **manage employees, job roles, departments, and job histories** efficiently while maintaining **data integrity** through **primary and foreign keys**.

1. Tables & Relationships

1.1 Locations Table (dbo.Locations)

- Stores location details where departments are situated.
 - **Primary Key:** Id
 - **Columns:**
 - Name (Location Name)
 - City (City Name)
 - Country (Country Name)
-

1.2 Departments Table (dbo.Departments)

- Stores department details.
- **Primary Key:** Id
- **Foreign Key:** LocationId (References dbo.Locations.Id)
- **Columns:**
 - Name (Department Name)
 - Description (Details about the department)

Relation: A **Location** can have multiple **Departments** (1-to-Many).

1.3 JobRoles Table (dbo.JobRoles)

- Stores job role information within a department.
- **Primary Key:** Id
- **Foreign Key:** DepartmentId (References dbo.Departments.Id)
- **Columns:**
 - Title (Job Title)
 - Description (Job Role Details)

Relation: A **Department** can have multiple **Job Roles** (1-to-Many).

1.4 Employees Table (dbo.Employees)

- Stores employee personal details.

- **Primary Key:** Id
- **Columns:**
 - Name
 - BirthDate
 - Phone
 - Email
 - Gender
 - Address
 - Status (e.g., Active, Resigned)

Relation: Employees are linked to **Job Histories** (1-to-Many).

1.5 JobHistories Table (dbo.JobHistories)

- Tracks employees' job history within the company.
- **Primary Key:** Id
- **Foreign Keys:**
 - EmployeeId (References dbo.Employees.Id)
 - JobRoleId (References dbo.JobRoles.Id)
 - ManagerId (References dbo.Employees.Id for reporting manager)
- **Columns:**
 - StartDate
 - EndDate
 - Status
 - Comments

Relation:

- Each **Employee** can have multiple **Job Histories** (1-to-Many).
 - Each **Job History** is linked to a **Job Role** (1-to-1).
 - An **Employee** can report to a **Manager** (Self-referencing FK).
